

SR+Trend v5 - Strategy Optimization Report

Document date: May 21, 2026
Strategy: SR+Trend v5 (Pine Script v6)
Execution timeframe: 5 minutes
Analysis basis: TradingView charts + strategy CSV exports (LDO, ENA, NEAR, APT)

1. Executive Summary

Your current uptrend stack - 1m×200 MA, 1h×400 MA, 4h×200 VWMA, 5m SuperTrend, 1m LinReg - correctly filters macro uptrends and produces strong results on trending altcoins (e.g. LDO ~47% net, APT ~41%, ENA ~32% on chart overlays).

The main performance drag is not ?wrong macro trend? but:

- 1. 5-minute chop inside an HTF uptrend - entries on S/R retests while local structure is flat or down.
- 2. Multiple competing soft exits - 4h MA, SuperTrend, 1m MA, and LinReg can close trades before trailing profit or HTF runners help.
- 3. Stop/target asymmetry - wide structure stops on volatile coins vs. sensitive micro exits on 5m noise.

Primary goal (your request): Find more accurate per-coin uptrend defaults, avoid false trades in uptrends, tighten stop logic, and maximize gain capture - without changing Pine code until you approve.

2. Your Current Setup

Layer	Setting	Role
TF1 MA	1m × 200 SMA	Short-term trend filter
TF3 MA	1h × 400 SMA	Medium HTF trend
VWMA	4h × 200	Volume-weighted HTF trend
SuperTrend	5m, ATR 15, mult 2.5	Chart-TF direction
LinReg	1m, length 6 (typical)	Entry candle filter (green / signal)
Entries	MTF S/R retest + strength	5m buy timing
Exits	Structure SL, TP ~1.75R, trail, HTF break runner, 4h MA exit, ST/1m MA/LinReg exits	Risk + regime + micro

Trading remains on 5m - all recommendations below only gate *when* 5m entries fire or *how* 5m exits behave.

3. Trade Data Summary (CSV Analysis)

Paired entry/exit rows from exported reports:

Coin	Trades	Win Rate	Profit Factor	Avg Win	Avg Loss	Net P/L % (CSV)
LDO	54	55.6%	2.90	+3.14%	?1.35%	57.3%
ENA	26	61.5%	2.99	+4.68%	?2.50%	46.4%
NEAR	27	63.0%	2.30	+2.94%	?2.17%	26.3%

APT 23 78.3% 7.46 +2.58% ?1.24% 38.3%

Note: Chart overlays may show different trade counts or net % if report date range or position size differs from CSV export.

Key patterns

Pattern LDO ENA NEAR APT

Quick false losses (<6h, never green) 31% of all trades 8% 22% 22%

Losses >2% (of all losses) 21% 80% 50% 0%

Chop cluster (3+ losses in 48h) Yes (?10.8%, ?8.0%) Yes (?9.8%) Yes (?17%) Minimal

Gave back >=1.5% peak profit 6 trades 6 trades 2 trades Rare

Exit signals (CSV): Almost all exits are Long X (bracket/trail/soft); MTF MA exit appears occasionally on ENA/APT/LDO.

4. How the Strategy Decides (Logic Map)

Entry (5m)

1. Valid support retest (touch window + pullback from above + optional reclaim block).
2. filtLong all true: MA uptrend (1m/1h/4h), 5m ST bull, LinReg long rule, VWMA, optional ADX/RSI/MACD.
3. Optional pivot strength near level.
4. Confirmed bar + cooldown + bar-close entry gate.

Exit (multiple paths - often overlap)

Mechanism Typical effect

- 1 Bracket SL (structure + ATR + swing) Hard stop
- 2 TP at ~1.75R Caps winners early
- 3 Trail after +1.75R unrealized Late profit protection
- 4 4h×100 MA cross down Regime exit
- 5 Close below 5m SuperTrend Micro exit
- 6 Close below 1m×200 MA Very sensitive on 5m
- 7 Close below 1m LinReg close Micro exit
- 8 HTF resistance break Drop TP, trail runner

Problem: Paths 5-7 fire frequently in chop before trail or HTF runner helps (visible on NEAR/LDO charts).

5. Root Causes of False Trades

5.1 Macro uptrend ? 5m tradable uptrend (NEAR, parts of LDO)

HTF MAs can slope up while 5m makes lower highs. Entries pass because close > MA on 1m/1h/4h. NEAR May 12-19 loss cluster is the clearest example.

5.2 Too many sensitive soft exits

useExitBelowMa1 (1m×200) and useExitBelowLinReg on a 5m chart react to noise. Many losses had

favorable excursion $\geq 1.5\%$ then closed red - profit given back.

5.3 Stop placement vs. volatility

structBuff = $3.25 \times \text{ATR}$ under support can place SL far away; when hit on ENA/NEAR, losses are $\approx 2.5\%$ to $\approx 5\%$.

5.4 Trail arms late vs. TP

trailTriggerR = 1.75 with tpR = 1.75 - trail often starts only at TP zone; soft exits cut trades before runner develops.

5.5 Stale retest window (LDO churn)

retestConfirmBars = 12 (~1 hour on 5m) + priorAboveLb = 2 allows entries on old touches in ranges.

6. Recommendations: Stronger Uptrend Detection

Keep core stack. Add one or two layers per coin (test in TradingView first).

6.1 HTF slope + separation (high value)

Rule Timeframe Suggested logic

MA slope up 1h & 4h MA $\geq$ MA[3] or MA[5] on HTF

Price separation 1h close $\geq$ 1h MA + $0.3-0.5 \times \text{ATR}(5m)$

VWMA vs SMA 4h (optional) 4h VWMA $\geq$ 4h SMA

Why: Blocks flat/grinding $\approx$ uptrends? and MA-hugging chop.

6.2 5m / 15m micro-trend (best for NEAR/LDO)

Tool Settings Role

EMA stack 5m EMA 21 $\geq$ EMA 55, close $\geq$ EMA 21 Local direction

15m SuperTrend ATR 10, mult 2-3 Fewer whips than 5m alone

LinReg rule Close $\geq$ signal or Both Stricter than green candle only

15m structure Last pivot high $\geq$ prior pivot high Simple higher-high filter

6.3 Regime strength (optional inputs already in script)

Filter Use on

HTF ADX (1h/4h, min 20-25, +DI $\geq$?DI) ENA, NEAR

RSI MTF (1h RSI 45-65 for longs) Block weak/overbought

MACD MTF (1h line $\geq$ signal) NEAR optional

APT: Base stack often sufficient (78% WR in CSV).

6.4 Volume & relative strength (optional)

Tool Rule

5m volume Entry bar volume $\geq$ SMA(20) of volume

vs BTC Coin 4h outperform BTC 4h - long leaders only

6.5 Additional indicators to test

- Aroon (1h): Up > 70 and Up > Down
- Hull MA (15m, 55): Smoother slope filter
- Chandelier exit (15m): Visual trend persistence

Rule: Add at most 2 layers - HTF slope + one micro filter.

7. Per-Coin Default Profiles (TradingView Saved Layouts)

Use separate Save as default presets per symbol.

APT (low volatility, clean retests)

Category Suggested values

Trend Current stack; ADX off

Entry Touch 0.7-0.8 ATR; retest window 8-10

Exits 4h MA ON; OFF exit below 1m MA

SL/TP structBuff 2.0; tpR 2.25; trailTriggerR 1.0

LDO (medium vol, higher trade count)

Category Suggested values

Trend + 1h MA slope; + 15m ST bull

Entry priorAboveLb 4-6; retestConfirmBars 6-8; srStrengthMin 2

Exits 4h MA ON; OFF 1m MA exit; limit LinReg exit in chop

SL/TP structBuff 2.0-2.5; cooldownBarsAfterExit 2

ENA (high volatility, large losers)

Category Suggested values

Trend Base + 1h ADX ≥ 22 + 5m EMA 21 > 55

Entry LinReg Both; touch 0.75 ATR; strength min 2

Exits Chandelier trail; HTF break ON; soft: ST + 4h MA only

SL/TP minSIDistAtr 0.25; test Percent SL 1.8% cap; trailTriggerR 1.0

NEAR (choppy inside HTF up)

Category Suggested values

Trend Base + 15m HH structure + 5m EMA 21 > 55 required

Entry retestConfirmBars 5-6; priorAboveLb 5; cooldown 3

Exits OFF 1m MA & LinReg exits; 4h MA + bracket + trail

SL/TP slSwingLb 12-15; structBuff 1.75-2.0

8. Stop Loss, Take Profit & Trailing

8.1 Stop loss

Parameter	Issue	Test range	Explanation
-----------	-------	------------	-------------

structBuff	3.25× ATR often wide	1.75-2.5 by coin	Smaller losses when wrong
------------	----------------------	------------------	---------------------------

slSwingLb	25 bars = 2h on 5m	12-18	Tighter swing anchor
-----------	--------------------	-------	----------------------

minSIDistAtr Too tight on ENA 0.15 APT/LDO; 0.25 ENA/NEAR Balance noise vs. risk

Max loss cap Not in script 1.2-1.8% entry (Percent SL test) Ceiling on worst trades

Principle: Tighter stop under retest low; failed retest should fail fast (~0.8-1.2% on 5m alts).

8.2 Take profit

Parameter	Suggested	Explanation
-----------	-----------	-------------

tpR	2.25-3.0	APT/LDO 2.5; ENA 3.0
-----	----------	----------------------

HTF break runner	ON for LDO/APT/ENA	Captures extension moves
------------------	--------------------	--------------------------

8.3 Trailing

Parameter	Suggested	Explanation
-----------	-----------	-------------

trailTriggerR	1.0-1.25 (not 1.75)	Protect profit before full TP
---------------	---------------------	-------------------------------

trailAtrMult	1.4-1.6 trend; 1.0-1.2 after HTF break	Volatility-adjusted
--------------	--	---------------------

trailStyle	Chandelier on ENA/NEAR/LDO	Reduces 5m wick stop-outs
------------	----------------------------	---------------------------

Soft exits	Delay until +0.5R or +1R (concept)	Stops green-then-red
------------	------------------------------------	----------------------

Alignment: If tpR stays 1.75, set trailTriggerR to 1.0 so trail can arm before TP fills.

9. Recommended Exit Hierarchy

Test manually in TradingView before any code change:

In long on 5m

-> If unrealized < +1R: rely mainly on bracket SL (+ optional tight emergency)

-> If unrealized >= +1R: enable Chandelier / HTF trail

-> Regime exit: 4h MA bearish cross -> close

-> Micro exit (per coin): 5m ST flip - optional on ENA only

-> Hold for HTF break runner when trend strong

Concrete toggle tests (no code)

1. OFF: Exit long below TF1 1m MA *(largest churn reducer)*

2. OFF or last: Exit below LinReg on NEAR/LDO

3. ON: 4h MA exit (regime)

4. ON: 5m ST exit for ENA only

5. ON: HTF break trail on LDO/APT/ENA

10. Entry Quality Parameters

Input	Direction	Why
-------	-----------	-----

retestConfirmBars	6-8 LDO/NEAR; 10-12 APT	Fresher retests
-------------------	-------------------------	-----------------

priorAboveLb	4-6	Real pullback from above
--------------	-----	--------------------------

srStrengthMin	2 on NEAR/ENA	Pivot confluence
---------------	---------------	------------------

lrLongRule	Both on NEAR/ENA	Momentum, not color only
------------	------------------	--------------------------

cooldownBarsAfterExit	2-3 NEAR/LDO	Stops re-entry loops
-----------------------	--------------	----------------------

useContLong	OFF until base tuned	Breakouts add chop risk
-------------	----------------------	-------------------------

touchAtrMult 0.65-0.80 by coin APT tighter; ENA slightly wider

11. Chart Observations by Coin

Coin What works What hurts

LDO Sustained trends, large +% runners Sideways clusters; many small Long X; soft exits cut winners

ENA Fewer trades, big +6-9% wins Large ?2.5%+ losses when wrong; needs ADX + trail

NEAR Good WR% but low net vs. trades Local downtrend still buys; 8 losses in 48h ? ?17%

APT Highest WR & PF; small losses Light tuning only; don?t over-filter

12. Suggested Testing Order (TradingView)

1. One change per coin: Disable ?exit below TF1 MA? -> Update report.
2. Overlay 1h MA slope - skip entries when 1h MA flat/down.
3. Overlay 5m EMA 21 > 55 - skip when false.
4. Tune structBuff + trailTriggerR together.
5. Save per-coin input presets (APT / LDO / ENA / NEAR).

Future Pine inputs (when you approve code changes)

- requireHtfMaSlope
- require5mEmaStack
- minUnrealizedRForSoftExit
- maxRiskPctCap

All should default OFF so live behavior unchanged until enabled.

13. Bottom Line

Finding Action

HTF uptrend stack works Keep 1m/1h/4h/VWMA/ST/LinReg core

Losses are 5m timing + exit stacking Add micro-trend gate; reduce soft exits

Biggest wins need runners Earlier trail + HTF break; higher tpR

Per-coin volatility differs Separate TV defaults - do not use one global preset

NEAR needs strictest filters 5m EMA + structure HH; disable 1m/LinReg exits

APT needs lightest touch Modest SL/TP tune only

14. Disclaimer

This report is based on strategy CSV exports and chart review as of May 21, 2026. Backtest results vary with date range, commission, slippage, and TradingView ?Recalculate after order is filled? setting. All parameter changes should be validated on your exact report range before live trading.
